KING WEST SUPPORTS

HAITI

TUESDAY FEBRUARY 2ND
 PLEASE COME SUPPORT HAITI IN THEIR TIME OF NEED
AT CENTURY ROOM
 583 KING STREET WEST, TORONTO 416.293.2226 WWW.CENTURYROOM.COM
THANK YOU TO EVERYONE FOR THEIR SUPPORT!
 IF YOU ARE UNABLE TO ATTEND, PLEASE VISIT <http://www.kwwest.ca/KWHAITI> TO MAKE YOUR CONTRIBUTION

React-native-android-action-sheet npm. React android app example. React native android app example. React native action sheet example.

A Cross Platform(Android & iOS) ActionSheet with a flexible api, native performance and zero dependency code for react native. 05 September 2020 Simple to use, static API, cross platform ActionSheets using Native Android ActionSheets and ActionSheetIOS. 09 July 2020 Cross platform ActionSheet. This component implements a custom ActionSheet and provides the same way of drawing it on the different platforms (iOS and Android). 15 December 2019 A popup container for implements your own popups like ActionSheet, Dialog, Alert, Toast. 24 June 2019 ActionSheet component for React Native (iOS and Android). 20 September 2018 react native action button. 01 May 2018 react-native-custom-actsheet Flexible custom ActionSheet for react-native. This module is wrapper for IActionSheet, which does all real work. GitHub 11 August 2017 ActionSheet is a cross-platform React Native component that uses the native UIActionSheet on iOS and a JS implementation on Android. Almost a drop in replacement for ActionSheetIOS except it cannot be called statically. Installation npm install @expo/react-native-action-sheet Try it out Try it in Expo: community/react-native-action-sheet-example Usage See the example app source Current Tags 0.3.0 latest (6 years ago) 8 Versions 0.3.0 [deprecated] 6 years ago 0.2.3 [deprecated] 6 years ago 0.2.1 [deprecated] 6 years ago 0.2.0 [deprecated] 6 years ago 0.1.3 [deprecated] 6 years ago 0.1.2 [deprecated] 7 years ago 0.1.1 [deprecated] 7 years ago 0.1.0 [deprecated] 7 years ago Does React Native have an equivalent of ActionSheetIOS for Android? Some sort of popup menu of options to choose from? Hey folks, let us try to build an iOS-like Action Sheet with React Native.Illustration By Udhaya Chandran(Skip to next section, if already done.)Go ahead to this link and follow the steps on creating a new react native project.To start the application run npx react-native run-ios inside your React Native project folder. Open your project in VS Code and head to the file named App.js.And remove the code under the return statement and replace it with:You have successfully finished creating a project.Let us create a folder src/actionSheet and a file index.jsThis is going to be our component.This component will require an array of action items of structure like this:Let us start coding the ActionSheet Component.This component accepts an array of action items, appends an object at the end.Additionally, we need to pass an onCancel callback which will close the Action Sheet.The component is styled as per an iOS Action Sheet.All we have to do now is to wrap the above component inside a and position it at the bottom of the screen.Okay now, let us see how this works.Works great. You can also pass in actionTextColor to change the color of the Label.This also works fine in Android. Let us try it with the different text color.Used libraries :This is Karthik representing Timeless.You can find the repo here.If you find this blog post helpful, share it with a friend.If you find any difficulties please feel free to add your comments. ActionSheet is a cross-platform React Native component that uses the native UIActionSheet on iOS and a JS implementation on Android. Almost a drop in replacement for ActionSheetIOS except it cannot be called statically. iOS Android Web Installation \$ npm install @expo/react-native-action-sheet \$ or \$ yarn add @expo/react-native-action-sheet A basic ActionSheet Setup 1. Wrap your top-level component with import { ActionSheetProvider } from '@expo/react-native-action-sheet'; class AppContainer extends React.Component { render() { return () } } 2. Connect your component which uses showActionSheetWithOptions. import { connectActionSheet } from '@expo/react-native-action-sheet'; class App extends React.Component { /* ... */ } const ConnectedApp = connectActionSheet(App); export default ConnectedApp; App component can access the actionSheet method as this.props.showActionSheetWithOptions _onOpenActionSheet = () => { // Same interface as const options = ['Delete', 'Save', 'Cancel']; const destructiveButtonIndex = 0; const cancelButtonIndex = 2; this.props.showActionSheetWithOptions({ options, cancelButtonIndex, destructiveButtonIndex, }, (buttonIndex) => { // Do something here depending on the button index selected }); }; You can use a hook instead of the higher order component if you are on React 16.8 or newer. import { useActionSheet } from '@expo/react-native-action-sheet'; export default function App() { const { showActionSheetWithOptions } = useActionSheet(); /* ... */ } Options The goal of this library is to mimic the native iOS and Android ActionSheets as closely as possible. This library can also be used in the browser with Expo for web. Universal Props The same options available on React Native's ActionSheetIOS component exist for both iOS and Android in this library. Note: disabledButtonIndices is only available for iOS in Expo 43+ or RN 0.64.0+. iOS Only Props Name Type Required Default anchor number No userInterfaceStyle string No anchor (optional) iPad only option that allows for docking the action sheet to a node. See ShowActionSheetButton.tsx for an example on how to implement this. userInterfaceStyle (optional) The interface style used for the action sheet, can be set to light or dark, otherwise the default system style will be used. Android/Web-Only Props The below props allow modification of the Android ActionSheet. They have no effect on the look on iOS as the native iOS Action Sheet does not have options for modifying these options. Name Type Required Default icons array of required images or icons No tintIcons boolean No true textStyle TextStyle No titleTextStyle TextStyle No messageTextStyle TextStyle No autoFocus boolean No false showSeparators boolean No false containerStyle ViewStyle No separatorStyle ViewStyle No useModal boolean No false (true if autoFocus is true) destructiveColor string No #432f2f icons (optional) Show icons to go along with each option. If image source paths are provided via require, images will be rendered for you. Alternatively, you can provide an array of elements such as vector icons, pre-rendered Images, etc. tintIcons (optional) Icons by default will be tinted to match the text color. When set to false, the icons will be the color of the source image. This is useful if you want to use multicolor icons. If you provide your own nodes/pre-rendered icons rather than required images in the icons array, you will need to tint them appropriately before providing them in the array of icons; tintColor will not be applied to icons unless they are images from a required source. textStyle (optional) Apply any text style props to the options. If the tintColor option is provided, it takes precedence over a color text style prop. titleTextStyle (optional) Apply any text style props to the title if present. messageTextStyle (optional) Apply any text style props to the message if present. autoFocus (optional) If true, will give the first option screen reader focus automatically when the action sheet becomes visible. On iOS, this is the default behavior of the native action sheet. showSeparators (optional) Show separators between items. On iOS, separators always show so this prop has no effect. containerStyle (optional) Apply any view style props to the container rather than use the default look (e.g. dark mode). separatorStyle (optional) Modify the look of the separators rather than use the default look. useModal (optional) Wrap the ActionSheet with a Modal, in order to show in front of other Modals that were already opened (issue reference). destructiveColor (optional) Modify color for text of destructive option. ActionSheetProvider Props The following props can be set directly on the ActionSheetProvider useNativeDriver (optional) Windows only option that provides the option to disable the native animation driver for React Native Windows projects targeting Windows 10 Version-1809 ; Build-10.0.17763.0 and earlier. useNativeDriver is supported in Version-1903 and later so if your project is targeting that, you don't need to set this prop. Try it out Try it in Expo: community/react-native-action-sheet-example Example See the example app. Usage \$ cd example \$ yarn / build simulator \$ yarn ios \$ yarn android / web \$ yarn web Development Setup \$ git clone git@github.com:expo/react-native-action-sheet.git \$ cd react-native-action-sheet \$ yarn Build We use bob. Lint & Format / tsc \$ yarn type-check // ESLint + Prettier \$ yarn lint Page 2 You can't perform that action at this time. You signed in with another tab or window. Reload to refresh your session.
